

GIS

A geographic information system (GIS) integrates hardware, software, and data for capturing, managing, analyzing, and displaying all forms of geographically referenced information.

GIS allows us to view, understand, question, interpret, and visualize data in many ways that reveal relationships, patterns, and trends in the form of maps, globes, reports, and charts.

A GIS helps you answer questions and solve problems by looking at your data in a way that is quickly understood and easily shared.

GIS technology can be integrated into any enterprise information system framework.

E-GOVERNANCE

Electronic Governance can be defined as giving Citizens the choice of when and where they access government information and services. Putting the Citizen at the center of government means taking a delivery channel view. This would mean using more and more of Electronics & Information Technology in many of the government functions. Electronic Governance thus, is the application of Information Technology to the processes of Government functioning to bring about transparency of the functioning. This IT enabled government will ensure better transparency and services to the public.
